

Custom Gorbel Easy Arm® Helps in Packaging Process

Using Float Mode has allowed workers to precisely place the parts and decrease product damage in the process.

A manufacturer of 7' long Flaptrack for aircraft was having frequent incidents of product damage as well as concerns about worker safety.

Workers were required to slide the 150lb. Flaptrack off of a forklift and into the work cell. The original application required them to rotate the part, and place it precisely in a machine center after sliding it off of the forklift. Not only were workers at serious risk for injury during this process, but the parts were often damaged during this difficult operation.

A 330lb. Easy Arm with Remote Handle was introduced to assist operators in gripping the large parts and rotating them 90 degrees in order to place them in the machine. Using Float Mode has allowed workers to precisely place the parts and decrease product damage in the process. The workers are happy with the ease of operation of the new Easy Arm, and the company is impressed with the increase in worker safety, and the immediate reduction of product damage.
