

Gorbel G-Force® Intelligent Lifting Device Handling Various Sizes With a Sensitive Touch

Features and Benefits:

- Increased productivity
- No longer waiting for a shared system (multiple bridges to cover stations)
- Variable speed programmability for sensitive lifts

At Woodward Inc. in Fort Collins, CO, a new facility was being built and equipped with Gorbel® Work Station Cranes, Jib Cranes and G-Forces throughout the plant. According to management, the flow of production has increased and they now have the right system in the right place. There is now active movement instead of waiting for a shared system. Woodward manufactures valves and actuators for gas and steam turbine power plants.

The G-Force® is being used in a multifaceted production area where there is a vast array of products that are produced and tested. What is important to the process is the sensitivity of the “lift” via the buttons for controlling the G-Force® and its variable speed is also very beneficial as the product needs to be lifted at its servo point and the G-Force® does this exceptionally well according to the operators.
