

CNH America – Tractor Tire Lift

Industry Group: Lift Manufacturers
Product Section (LMPS)

The Customer Requirement

Our customer CNH America, a global manufacturer of agriculture and construction equipment required a lift system in their tractor manufacturing location to raise their tractors weighing 50,000 lbs. in order to change out the temporary tires and replace with actual tractor tires before shipping out to customers.

Solution

Autoquip's Vertical Dual Ram Lifting system was just what was required to get the job done. The dual-platform lift system is pit mounted and designed small enough in width to cradle the tracker frame so it will not interfere with the tire change out. The dual ram dual platform design is capable of lifting the front and rear of the tractor safely and steadily with a capacity of 50,000 for the complete lift system.

Benefits

The custom design of this Dual Ram Lift System will improve productivity for CNH making the last line of assembly for changing out tires more efficient and quicker before loading up the tractors and shipping out to customers.
