

Operators More Productive with Addition of Wall Bracket Jib Crane

Features and Benefits

With the cranes in place, workers are able to lift and position every attachment and die for the press with precision.

" I had seen Gorbel cranes in other facilities around town, and I knew that it would solve our problems."

"The Gorbel crane was just the right fit, and a very safe solution for the work we do," said Olendorff. "From the small jobs, the rotary die cutting and tooling to the larger jobs with the rotary screen units. We use the crane for everything. We just couldn't do it all without the crane system."

Industry Group: MHI INDUSTRY GROUP

Prime Package & Label is a major nationwide provider for printed labels and other consumer products. Recently, the company added in several printing presses. The presses feature multiple attachments that can be put at different locations along the press and fall with the range of 200-400 pounds. Several times per shift, as one printing job finishes and a new order is prepared, the attachments and dies must be changed out.

The Problem:

- Tight manufacturing footprint - no floor space for forklift traffic
- A Jib Crane did not provide maneuverability needed
- The rail system used provided coverage but was still limited

The company purchased two freestanding work station bridge cranes, each 60 feet long with one 14' 1000 pound capacity bridge. With the cranes in place, workers are able to lift and position every attachment and die for the press with precision. Gorbel was able to match the paint color perfectly to the control panels of the Mark Andy printing press.
