

Heavy Duty protection for Building Columns

Features and Benefits

Designed and tested to protect building columns from impact without reliance

on the columns for shock absorption. Circular with minimal footprint - does not protrude. Installation complete in less than 30 minutes. Size is customizable to accommodate any mechanicals running alongside the columns.

Made of 1/4" thick structural steel.

Industry Group:

The Protective Guarding Manufacturers Association (ProGMA)

Heavy Duty Building Column Protector

The Opportunity

A brand new facility owned by a company who, from experience with other warehouses, wanted to protect all of its 10"x10" building columns against forklift impact. As a prevention strategy, a heavy-duty permanent solution was required.

The Solution

For the protection of their building columns, shields were installed across the new facility. The heavy-duty solution does not touch the building column and in doing so, does not rely on it in case of impact. The shield is made of 1/4" thick structural steel. Simply put, it is designed to live up to its name and protect columns from damage, permanently.
