

# Elevating Rack Guard

Protects Rack Bays

**InCord**<sup>®</sup>  
Custom Safety Netting Solutions

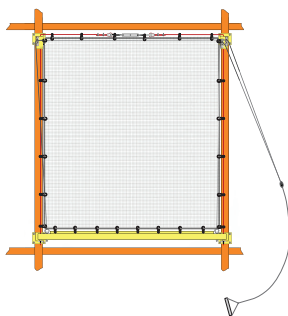

InCord Elevating Rack Guard (ERG) is an actuating system designed to guard and allow access to the same side of a rack. It attaches to existing rack frames with U-bolts and steel brackets that support the load-bearing cables.

- Front-of-rack protection while allowing access
- Easy one-person pull cord operation to open or close
- System can be expanded by converting a single-bay into a multi-bay system with shared components

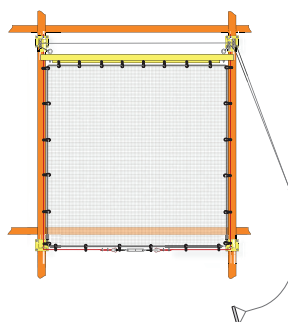

## Drop to close or drop to open

Elevating Rack Guard can be configured to open from either the top or bottom of the rack bay.

### Drop to close:

Pull the cord to raise the ERG gate open and feed it back to lower closed.

### Drop to open:

Feed the cord up to lower the ERG gate open and pull down to raise closed.
