

Scissors Lift Tables Solve an Ergonomic Problem for an Office Manufacturing Company

Features/Benefits Provided:

- Improved productivity and worker satisfaction
- A definite reduction in the number of claims in worker's compensation that could be directly attributable to back injuries.

This company specializes in the production of office furniture. The production process includes a sanding operation to prepare the tops of conference tables for various stains and final finish.

The Problem:

Operators employed in sanding the table tops formerly worked at 30" high work platforms – a height too low for comfortable sanding of hard to reach areas. Excessive bending and stretching led to numerous back complaints. "One of the primary concerns is the welfare of our workers. We recognized we had an ergonomics problem at the sanding work station and we set about correcting it."

The Solution:

Management has been working on ergonomic improvements at the plant for several years and, after consultation with the area distributor for our company, a lift table was installed for the sanding operation. The lift table is used to elevate the entire work station platform, table top, and all – to positions that eliminate bending and stretching on the part of the operators. The table proved to be the first of 14 lifts that have since been installed at the plant for a variety of ergonomically beneficial applications.

Among its features are a large 24" x 48" platform, heavy gauge steel components, a full 36" lift, and profiled legs for added strength. All pivot points have hardened and ground pins that operate in lubricated for life, virtually maintenance-free bushings. Heavy-duty hoses have a burst strength 350% greater than the hydraulic operating pressure. Human engineered controls include a choice of pushbutton or foot switch operation for fast, precise positioning at desired heights. The entire table, including power unit, controls, and hydraulic fluid, is shipped fully assembled and ready to use.

"In addition to improved productivity and worker satisfaction, we've had a definite reduction in the number of claims in workman's compensation that could be directly attributable to back injuries. The units have really done the job for us."
