

Automated Production Systems

Lighting

The Bradbury Group's rollformers and related production equipment can be designed to produce fluorescent channels, troffers, reflectors, louvers, blades, and covers from gloss-painted steel and highly polished aluminum. We build machines that process material with critical cosmetic surfaces. In-line precision punching and notching make your designs assembly-ready. See us for manufacturing equipment to produce everything from under-counter lighting to commercial and industrial fluorescent light fixture components.

Double Wide® Rafted® Lighting Rollformer

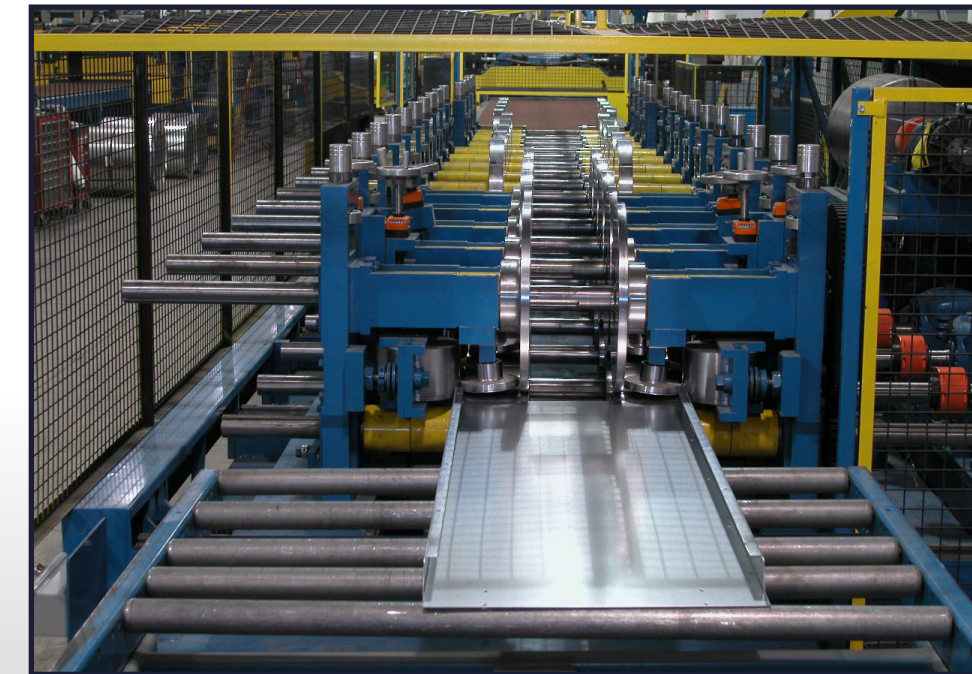

HVAC

The Bradbury Group's Automated Production Systems (APS) can combine rollforming, cut-to-length, and slitting with various other processes, such as punching, feeding and bending, welding, and robotics to incorporate a complete production process into one production line. Solutions of this nature provide high production on a family of related products with minimal tooling change. A variety of options are available – from coil-fed to blank-fed lines and sub-assembly of components for your heating, ventilating, and air conditioning systems.

Specialty

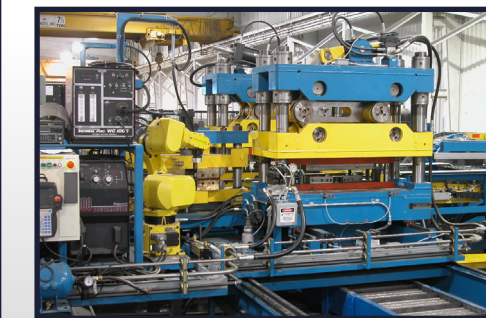

The Bradbury Group® specializes in designing and building customized manufacturing equipment for your unique product, production requirements, and structure configurations. Some examples of Bradbury Group's specialty lines include fence rail, razor wire, shelving and racking, hot water heater components, and vending machine cabinets.
